CAROUSEL

A chat message became a governed decision

One synthetic brake fault on forklift A-142, followed from a group-chat message to a recorded human approval. Every name and record is fictional.

It started as one line in a chat

May 18. A worker writes that the brakes grind and the pedal feels spongy, and mentions brake work "back in the spring". The forklift is still stopping.

Five more records held the rest

An April pad-replacement CSV, a May inspection report, a June 2 ramp incident, a hold-from-service email and a repair update.

One vague phrase went to a person

"Brake work done in spring" came out at 70% confidence, so it was queued for review with the exact words underlined, not accepted.

Dana Osei, 2026-05-18 09:15

it's still stopping, just doesn't feel right. wasn't like this last week. I know it had brake work done back in the spring so figured someone should take a look before it gets worse

70%

A written rule did the counting

Rule safety-critical-removal-approval needs a safety-critical reading plus at least two related events inside 60 days. In the recorded case it counted four.

FACT	RESOLVED VALUE	SOURCE
observation(severity-indicator).value	safety-critical	this event's observations
related-event-count within 1440h	4	aggregate over 4 related event(s)

Condition tree

Pass — ALL of

- Pass — observation(severity-indicator).value = safety-critical (resolved: safety-critical)
- Pass — related-event-count within 1440h ≥ 2 (resolved: 4)

The rule proposed. It did not decide.

The output is a critical-risk "remove from service" decision, awaiting approval. The rule only proposes. A person has to approve it.

Remove From Service: remove-from-service Risk: critical

Repeat safety-critical fault on a braking or other safety-relevant component; asset must not return to service without explicit human sign-off.

Evidence: A-142 brake failure on yard ramp, this was close and it happened on an incline with people working nearby., 2026-04-06: brake pad replacement by Ferrow Industrial Services, formally requesting that A-142 be held from service effective immediately., Priya Nandakumar <p.nandakumar@northgatedc.example>, Date: 2026-06-02

Triggering rule: safety-critical-removal-approval v1.0.0

Potential consequence: The underlying critical risk remains unmitigated in the workspace until this decision is resolved.

Required approver: Asset Removal Approval

Approve Reject Request more information

Approval is its own record

A person approves with a required comment. That creates a separate Approval with approver, outcome and time, and only then does the decision move to approved.

Every step is in the audit trail

The review acceptance and the approval each leave an entry. Each entry has an actor, a subject and a timestamp, and the trail exports as CSV or JSON.

Confirmed with the maintenance lead — hold A-142 from service pending inspection.

Approved is not the same as done

After approval the case is still open and the inspection action still has no completion recorded. The system does not assume a repair happened.

Case detail: the case is Open and the inspection action item is still open.

What this is, and what it is not

Synthetic data. A fixture provider replays authored extractions; no live model. The approval was scripted and no maintenance lead was consulted. A demo, not production.
